In this project, the idea is to create a user interface which predicts age, gender and code of the country a person belongs to when enters a name.

All the above listed operations are results of invoking REST APIs. Please refer the attached screenshots.

The code up to this point has been saved in another text file by the name RESToutput.

I have tried implementing SOAP API which essentially outputs the capital city of all the countries predicted I failed to make it work by using just REACT for both front end and back end.

Used postaman to evaluate if the api is working, referred the code given in postman to implement in my app.

Got CORS error, after rectifying that I stumbled upon Webpack 5 Errors - Cannot Resolve 'crypto', 'http', and 'https' in ReactJS Project. While trying to resolve this error, I was getting babel-jest error.

Currently working on node.js for backend and react for front end. Unlike in this submission where I tried implementing both on REACT. I intend to finish it off before tomorrow.

npm i axios --save

npm start

These commands will make the rest api's script work.
